The Bingham Facility

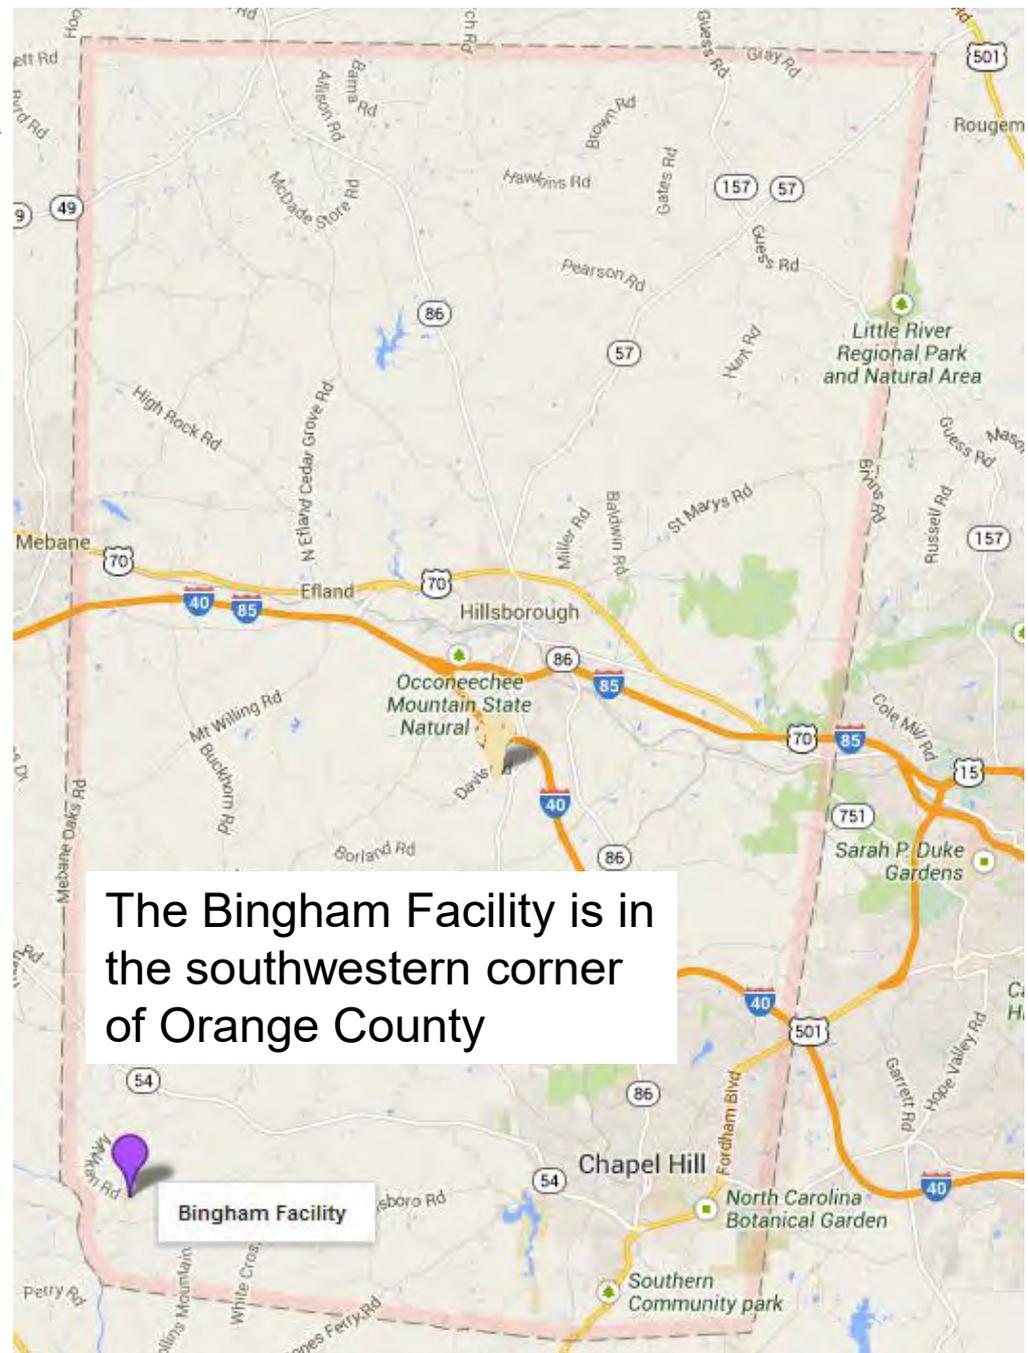

Robert P. Lowman, Ph.D.
Associate Vice Chancellor for Research
Research Professor of Psychology

Environmental Review Commission
January 15, 2014

The Bingham Facility

The facility was built in the 1970s on a 56-acre, mostly wooded tract owned by the University in rural Orange County.

It began as one building and pasture for large research animals, like dogs and pigs, similar to a farm.

Now the Bingham Facility consists of three buildings to house animals, a wastewater treatment system and basins for holding treated wastewater. This aerial view also shows three buffer UNC properties.

The Bingham Facility

- Designed to house large animals in keeping with its rural surroundings
- Also serves as a place to observe new animals before bringing them in contact with research animals on campus

These were the primary reasons for choosing a site in rural Orange County, separate from the main campus in Chapel Hill.

The Bingham Facility

Since the 1970s, this rural facility has been a vital part of Carolina's research mission. Shown here are the original building (white) and a second building (gray), constructed in 2007.

Carolina is a national leader in research

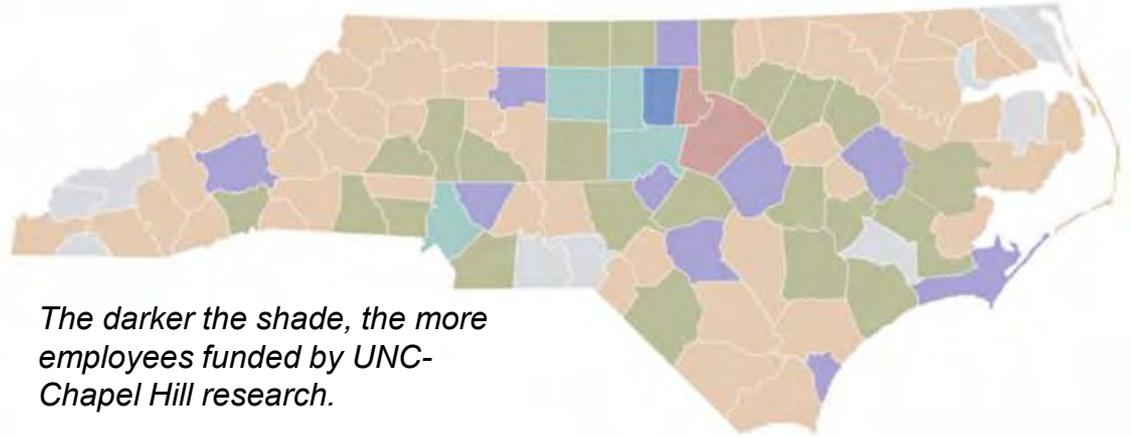

Based on the most recent available data, Carolina ranks:

- 1st (in a 7-way tie) among the nation's public research universities (Top American Research Universities, 2011)
- 9th in federal Research & Development expenditures (National Science Foundation or NSF, 2012)
- 11th in overall Research & Development expenditures (NSF, 2012)
- 7th among all universities in Health and Human Services expenditures, including the National Institutes of Health (NSF, 2012)
- 42nd among the world's top 400 universities (*Times Higher Ed.*, 2012–13)
- 20th among U.S. universities and 31st in world ranking (University Ranking by Academic Performance, 2012)

Carolina research means support and jobs for NC

- **\$79 million** in technical assistance and support provided to professionals, public officials and organizations in NC
- More than **5,000 full-time jobs** funded
- At least **13,230 jobs** created annually throughout NC

UNC-Chapel Hill research dollars pay the salaries of employees in almost every North Carolina county.

Carolina research also translates into **healthcare benefits** and **quality of life improvements** for residents of every county in North Carolina.

School of Medicine Research

At Carolina, the academic unit that receives the most research funding is – by far – the **School of Medicine**.

\$391.5 million from all sources in 2012

51 percent of all UNC-Chapel Hill research funding

Studying blood disorders and heart disease

One of the first and longest-running NIH grants (1947-1999) went to a UNC researcher studying blood disorders. The work of **Dr. Kenneth Brinkhous** (left) continues today at UNC, led by **Dr. Timothy Nichols**, (below).

Studying blood disorders and heart disease

Colonies of dogs born with bleeding disorders, such as **hemophilia** and **von Willebrand disease**, help researchers develop gene therapy for dogs as well as humans.

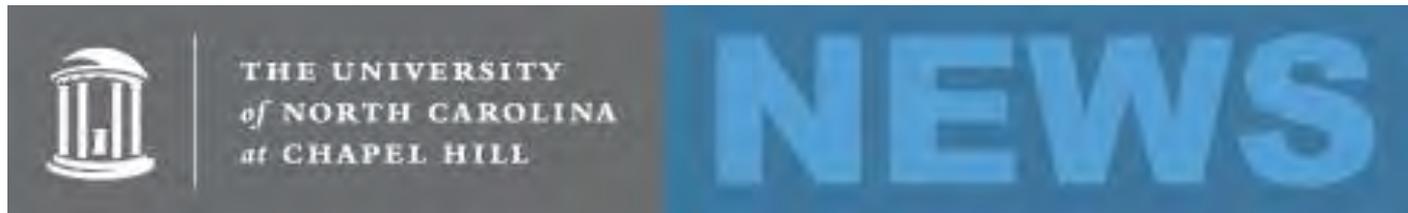

To learn more about thrombotic disorders related to **atherosclerosis**, **heart attacks** and **strokes**, researchers study pigs.

These large animals have been housed at the Bingham Facility.

This figure shows the synthesis and trafficking of BDDFVIII into canine platelet α -granules.

New study results announced just last month

New gene therapy proves promising as hemophilia treatment

December 10, 2013

Researchers at [the UNC School of Medicine](#) and the Medical College of Wisconsin found that:

- a new kind of gene therapy led to a dramatic decline in bleeding events in dogs with naturally occurring [hemophilia A](#), a serious and costly bleeding condition that affects about [50,000 people in the United States and millions more around the world](#).
- Before the gene treatment, the animals experienced about five serious bleeding events a year. After receiving the novel gene therapy, they experienced substantially fewer bleeding events over three years, as reported in the journal [Nature Communications](#).

The Bingham Facility

Previous Expansion Plans

A second building to house animals was built on the Bingham property in 2007.

In 2008, the School of Medicine planned to expand the rural facility with four more buildings:

- To consolidate dogs from the Francis Owen Blood Research Laboratory at Bingham for easier veterinary care and less travel
- To replace leased space in Hillsborough that housed a different colony of dogs used to study muscular dystrophy
- To accommodate current research using other large animals

The Bingham Facility

Expansion Mistakes

- Miscalculations of the amount and type of wastewater generated and total amount of water needed for operations resulted in a plan that could have severely stressed the Bingham Facility site.
- Further, the new wastewater treatment system installed at that time was undersized for the buildings that were proposed.
- Plastic linings in wet weather storage basins failed.
- Some road and basin construction encroached on 0.14 acre of wetland areas without appropriate permits.

The Bingham Facility

Results of Expansion Mistakes

- The failure of the plastic lining of the large wet weather storage basin led to a slow leak of highly treated wastewater that eventually reached a Collins Creek tributary, resulting in DENR violation and fine.
- Frozen and burst pipes led to a leak of highly treated wastewater and a DENR violation.
- 0.14 acre encroachment on wetlands resulted in US Army Corps of Engineers citation and required mitigation of impacts.

The Bingham Facility

Lessons Learned

- We canceled the construction of three of the four planned buildings and returned construction grant money to NIH.
- We stopped using the site wastewater systems and are removing it and replacing it with a new site wastewater drip irrigation system.
- We restored or mitigated impacts on wetlands.
- We determined we did not need to increase overall water use.

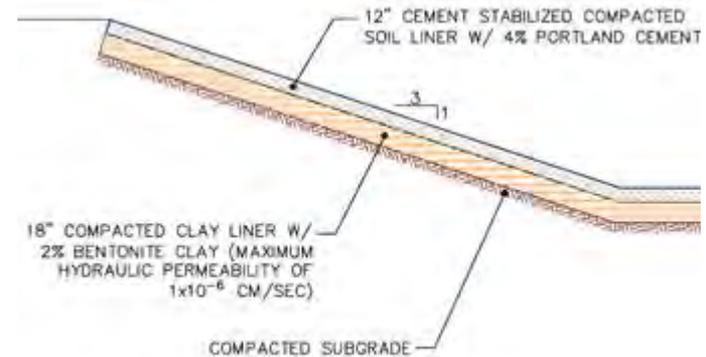

New drip irrigation system replaces old spray irrigation system.

The Bingham Facility

Lessons Learned

- We redesigned the system, drained the wet weather storage basins, removed the plastic liners and are rebuilding the basins with clay liners.
- After a public hearing, we received a new permit from DENR.
- We are managing animal waste differently.

New clay lining is 1.5 feet thick.

Dry bedding reduces water usage.

The Bingham Facility

Lessons Learned

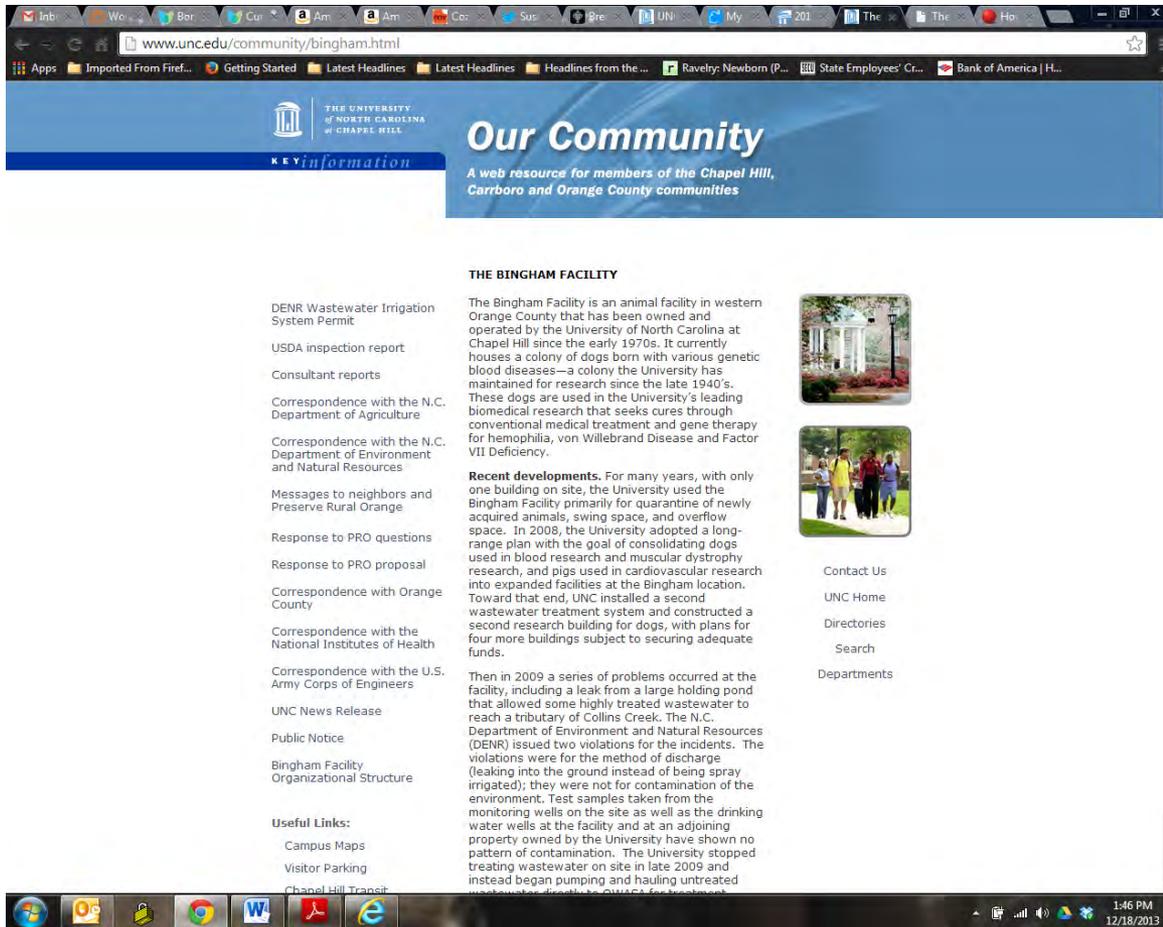

- We purchased the three adjacent properties most directly impacted by our activities at Bingham.
- These properties are NOT part of the Bingham Facility. They are fenced off and managed separately as rental properties by the UNC Property Office.

We have NO PLANS to expand the Bingham Facility beyond the current 56-acre tract.

The Bingham Facility

THE BINGHAM FACILITY

The Bingham Facility is an animal facility in western Orange County that has been owned and operated by the University of North Carolina at Chapel Hill since the early 1970s. It currently houses a colony of dogs born with various genetic blood diseases—a colony the University has maintained for research since the late 1940's. These dogs are used in the University's leading biomedical research that seeks cures through conventional medical treatment and gene therapy for hemophilia, von Willebrand Disease and Factor VII Deficiency.

Recent developments. For many years, with only one building on site, the University used the Bingham Facility primarily for quarantine of newly acquired animals, swing space, and overflow space. In 2008, the University adopted a long-range plan with the goal of consolidating dogs used in blood research and muscular dystrophy research, and pigs used in cardiovascular research into expanded facilities at the Bingham location. Toward that end, UNC installed a second wastewater treatment system and constructed a second research building for dogs, with plans for four more buildings subject to securing adequate funds.

Then in 2009 a series of problems occurred at the facility, including a leak from a large holding pond that allowed some highly treated wastewater to reach a tributary of Collins Creek. The N.C. Department of Environment and Natural Resources (DENR) issued two violations for the incidents. The violations were for the method of discharge (leaking into the ground instead of being spray irrigated); they were not for contamination of the environment. Test samples taken from the monitoring wells on the site as well as the drinking water wells at the facility and at an adjoining property owned by the University have shown no pattern of contamination. The University stopped treating wastewater on site in late 2009 and instead began pumping and hauling untreated wastewater to the Orange County Wastewater Treatment Plant.

Lessons Learned

- We began meeting and communicating with neighbors and Preserve Rural Orange.
- We posted permits and correspondence on the Bingham website.

Visit the Bingham Facility website at <http://www.unc.edu/community/bingham.html>.

THE UNIVERSITY
of NORTH CAROLINA
at CHAPEL HILL

The Bingham Facility

Lessons Learned

- We added extensive landscaping that will—in time—provide a better shield between Bingham and its nearest neighbors.
- We have taken aggressive steps to reduce the noise of chillers and fans on site and to reduce night lighting—all to minimize the impact of Bingham on its neighbors.

Thank you for your time
and attention.

I would be pleased to
respond to your questions.
